To Whom It May Concern:

RE: Green Energy Panels

As President/CEO of a large network of senior living facilities, I am always on the lookout for ways to improve our facilities while managing costs effectively and keeping pace with the ESG initiatives. I was introduced to Green Energy Panels and their copyrighted power conditioning system earlier last year and decided to install the panels in 3 of our locations in Arizona and Texas as part of a pilot program.

The results were outstanding. Upon installation and full calibration of the system, the results far exceeded the projected 10% cost savings we were told to expect. Along with the cost savings, the system serves to greatly improve the lifespan of our equipment, as well as a voltage surge protector.

The decision to implement this energy-saving technology has not only resulted in financial benefits but has also aligned with our commitment to sustainability. It's a win-win situation where we save on costs and contribute to a greener planet. I wholeheartedly recommend this solution to any facility looking to reduce energy expenses and enhance their operational efficiency. I am currently moving forward with the next phase to install Green Energy Panels in more of our facilities.

Sincerely,

Greg Roderick, President/CEO
